How do I reverse a string in Python? Show me a few different ways.

just now

There are several ways to reverse a string in Python:

1. Slicing (most Pythonic)

```
s = "hello"
reversed_s = s[::-1]
print(reversed_s) # "olleh"
```

2. Using `reversed()` + `join()`

```
reversed_s = "".join(reversed(s))
```

3. Loop

```
for char in s:
    result = char + result
```

The slicing method `[::-1]` is generally preferred for brevity.
